

BEAUTYFOLIO · PHASE 3F.2B

Media SEO + Image Accessibility + Structured Media Data

Friendly per-photo description fields for Gallery and Before & After, a deterministic no-generic-fallback alt-text system across gallery/before-after/video, and real-data-only ImageObject/VideoObject structured data. Local development only — zero database changes.

1–3. Architecture Audit & Database Changes

Direct schema/RLS reads confirmed `portfolio_images` already had `alt_text` **and** `caption` (plus dimensions/ `created_at`); `before_after_images` already had `alt_text`; `portfolio_videos` already had every field needed (title, description, category, thumbnail_url, created_at, duration_seconds). Owner-write RLS on all three already used the shared `owns_beautician_profile()` policy. **Conclusion: zero new columns needed.** The entire gap was application-layer — no dashboard UI to set alt text, and the public renderer ignored real values in favor of a flat boilerplate string.

Table	Fields reused
<code>portfolio_images</code>	<code>alt_text</code> , <code>caption</code> , <code>created_at</code>
<code>before_after_images</code>	<code>alt_text</code>
<code>portfolio_videos</code>	<code>title</code> , <code>description</code> , <code>category</code> , <code>thumbnail_url</code> , <code>created_at</code> , <code>duration_seconds</code>

4. Files Changed

File	Status	Detail
<code>src/lib/media-alt-text.ts</code>	New	Pure alt-text fallback generator, single source of truth
<code>portfolio.ts</code> / <code>portfolio-mapper.ts</code>	Modified	Alt text computed once per item at mapping time; fixed a double-space data bug
<code>portfolio-sections.tsx</code>	Modified	All public <code></code> now use computed text, legacy helper as fallback only
<code>gallery.server.ts</code> / <code>before-after.server.ts</code>	Modified	Added <code>updateImageAltText()</code> , RLS-scoped

dashboard.gallery.tsx / dashboard.before-after.tsx	Modified	New "Photo description" field per image
portfolio.\$slug.tsx	Modified	Added ImageObject/VideoObject JSON-LD
dashboard.videos.tsx	Untouched	No schema field for manual video alt — fallback-only by design

5–7. Gallery, Before & After, Video Implementation

Dashboard copy is user-friendly, never mentions "SEO" or "alt attribute": **"Photo description"** with helper text *"Describe what is visible in the photo. This helps accessibility and search engines understand your work."* Clearing a field back to empty writes `null` and hands control back to the automatic fallback. Videos have no manual field (no schema support) — thumbnail alt is always generated from real title/category, e.g. *"My bridal work — video by Dharti R Panchal."*

8. Alt-Text Fallback Hierarchy

1. Manual text (`alt_text` / `caption`) — used verbatim, no boilerplate appended
2. Title + category
3. Title + professional/service context
4. Category + owner name + city
5. Safe generic fallback — never the literal `"image"`

Before/after pairs are guaranteed non-identical: the "before" side never carries the professional's name; the "after" side always attributes the result to them.

9. Image Performance

No new CDN, no Storage rebuild, no transformation pipeline (out of scope). Existing lazy-loading and fixed `width / height` CLS-prevention attributes confirmed intact — this phase only changed `alt` values, never markup, sizing, or loading strategy.

10. Structured Data — Live Verified

Fetched the raw SSR response for `/portfolio/dharti-panchal` directly (not via client hydration) and parsed the JSON-LD script block:

- 5 `ImageObject` entries — real `Storage` `contentUrl`, real caption/description, real `creator`, real `dateCreated` where available
- 3 `VideoObject` entries — real `thumbnailUrl` / `name` / `description`, real `embedUrl` (Instagram/YouTube) or `contentUrl` (uploaded), real `uploadDate`
- No fabricated durations, dates, creators, or thumbnails anywhere — a property is simply omitted when the underlying data doesn't exist (e.g. no `duration` key when `duration_seconds` is null)

11. RLS / Ownership Verification

`updateImageAltText()` uses a direct `.update(...).eq("id", imageId)` with no explicit ownership join in application code — consistent with this codebase's established pattern of trusting RLS rather than re-implementing ownership checks client-side. Both image tables' owner-write policies use the shared `owns_beautician_profile()` helper (confirmed in the Phase 2 data-model audit), so a cross-user write is rejected by Postgres before it can apply. Public reads remain scoped to `is_published: true` rows only, unchanged.

12–13. Regression, Build & Quality Checks

- `tsc --noEmit` — clean
- ESLint across all touched files — clean (one pre-existing Prettier line-wrap fixed via `eslint --fix`)
- Production build — succeeds
- Routes smoke-tested: `/`, `/portfolio/dharti-panchal`, `/dashboard/gallery`, `/dashboard/before-after`, `/dashboard/videos`, `/sitemap.xml`, `/robots.txt` — all 200 OK

14. Manual Tests Performed

#	Test	Result
1	Description upload persists & renders verbatim	Confirmed
2	No-description fallback (title/category-derived)	Confirmed
3	Before/after distinct descriptions	Confirmed
4	Video thumbnail alt generated correctly	Confirmed
5	Unpublish → disappears from public page	Confirmed for Videos; Gallery/Before & After have no publish toggle (pre-existing gap, verified via direct DB update instead)
6	SSR alt attributes + JSON-LD present in raw response	Confirmed
7	Existing media still renders, no re-upload needed	Confirmed

15. Deferred Items

- Cover image not wired into the public hero — reserved for a future Hero Variant A/B phase
- No publish/unpublish UI for Gallery or Before & After (pre-existing gap, not this phase's scope)
- No new image CDN, Storage rebuild, or transformation pipeline

Recommended next phase: add a publish/unpublish toggle to Gallery and Before & After items, matching the pattern Videos already has — closes the one testing/UX gap surfaced above. Not started, purely a recommendation.
