

BEAUTYFOLIO · PHASE 3F.2B.1

Gallery + Before/After Media Visibility Controls

Closes a pre-existing UX gap: Gallery and Before & After items had no way to hide/publish from the dashboard, even though the public query already filtered on `is_published`. Zero database changes, zero redesign, no SEO logic touched.

Module	Database changes	Scope
Media Visibility	None	Gallery + Before & After only

SCHEMA CHANGES

4
FILES CHANGED

2
NEW DASHBOARD
SWITCH CONTROLS

0
PUBLIC QUERY CHANGES
NEEDED

1. Existing Visibility Architecture Discovered

`portfolio_items.is_published` and `before_after_items.is_published` already existed (item/pair-level, not per-image), defaulted to `true`, and the public query in `portfolio-query.server.ts` was **already filtering on both** — identical to how `portfolio_videos` was already filtered. The entire gap was UI-only: nothing in the dashboard ever set these columns to `false`. No duplicate visibility column (`visible` / `active` / `is_visible`) was needed or created.

2–3. Files Changed & Database Changes

File	Status	Detail
<code>gallery.server.ts</code>	Modified	<code>createPortfolioItemWithImages</code> / <code>updatePortfolioItem</code> accept optional <code>isPublished</code>
<code>before-after.server.ts</code>	Modified	<code>createBeforeAfterPair</code> / <code>updateBeforeAfterItem</code> accept optional <code>isPublished</code>
<code>dashboard.gallery.tsx</code>	Modified	New Switch control, Hidden badge, All/Published/Hidden filter
<code>dashboard.before-after.tsx</code>	Modified	Same pattern, pair-level switch

Database changes: none. Reused `is_published` on both tables exactly as it already existed.

4. Gallery Visibility Implementation

A real `Switch` component (not a checkbox/radio, per spec) labeled **"Show on my portfolio"**, with contextual copy — *"Visible to visitors on your public page"* when on, *"Hidden from your public page. Still saved and editable here"* when off. Defaults to on for new items; preloads the item's current value when editing.

5. Before & After Visibility Implementation

One switch per pair — **"Show this transformation on my portfolio"** — matching the schema's pair-level storage. Because there is only one flag for both images, the "before visible, after hidden" inconsistent state the spec warned against is structurally impossible.

6. Public Rendering Behaviour

Unchanged code path — `getPublishedPortfolioBySlug()` was already excluding `is_published: false` rows before this task, so a hidden item simply stops being fetched server-side. It never reaches the mapper, the public page, or triggers an empty-section render (sections already only render when non-empty).

7. Structured-Data Exclusion Behaviour

Automatic, no code change required: `buildImageObjects / buildVideoObjects` in `portfolio.$slug.tsx` only iterate `profile.gallery / profile.transformations`, which are built from the already-filtered bundle. A hidden item cannot appear in `ImageObject` JSON-LD because it never enters the mapped profile at all.

8. RLS Verification

`updatePortfolioItem` / `updateBeforeAfterItem` write through the same `owns_beautician_profile()` -gated RLS policies already verified in Phase 3F.2B. No new write path was introduced — publish/hide is just another field on an already owner-scoped update, so cross-user visibility changes are rejected identically to any other field.

9. Tests

- `tsc --noEmit` — clean
- ESLint (all 4 changed files) — clean
- Production build — succeeds
- Smoke test: `/dashboard/gallery` , `/dashboard/before-after` , `/portfolio/dharti-panchal` — all 200 OK

10. Manual Tests For You To Perform

I don't hold your dashboard login or a service-role key, so I verified the code paths and the pre-existing filter logic but couldn't click through a live toggle myself. Please check:

1. Hide a Gallery image → refresh → it disappears from `/portfolio/dharti-panchal` but stays editable in the dashboard
2. Publish a hidden Gallery image → it reappears publicly
3. Hide a Before/After pair → disappears publicly; publish it → reappears
4. Confirm your saved photo description is still intact after toggling visibility
5. With an item hidden, view the public page source and confirm its `ImageObject` entry is gone from the JSON-LD
6. Refresh / log out and back in — hidden state persists
7. Upload, edit, and delete still work normally on both pages

11. Known Limitations

- The All/Published/Hidden filter is a simple client-side filter over already-loaded items — no server-side pagination change
- Videos' existing visibility control (a Checkbox) was intentionally left untouched, so it now looks slightly different from the new Switch-based Gallery/Before & After controls — flagged, not fixed, since only the Gallery/Before & After gap was in scope

No redesign, no Media SEO logic change, no storage architecture change, no public layout change. Stopped after this task — no further phase begun automatically.
