

BEAUTYFOLIO · PHASE 3F.3

Semantic + Local SEO Authority

Combines existing profile, service, review, media, and location data into one coherent Person + LocalBusiness structured-data entity graph — and fixes two critical fabricated-data bugs found during audit. Zero database changes, zero landing pages, zero AI SEO.

Module	Database changes	Scope

@GRAPH NODES LIVE-
VERIFIED

Critical finding, fixed this phase: `aggregateRating` was built from static `beautician_profiles.rating / review_count` columns with no dashboard field and no sync to the real reviews table — live-verified showing **4.9 / 214 reviews** while the actual published `review[]` array contained only **3** reviews averaging **4.33**. This is exactly the kind of mismatch Google's Rich Results policy flags. Now computed live from real review rows.

1. Existing Semantic Architecture Discovered

JSON-LD was a flat array of independent objects with no shared `@id` — `founder`, `creator`, and `provider` each re-declared a duplicate inline Person object instead of referencing one entity. `sameAs` was never populated despite real Instagram/Facebook/YouTube/website URL fields already existing on the Profile page. `areaServed` vs. primary location were already correctly distinguished — no fix needed there. Homepage canonical/ `og:url` were present but relative, not absolute.

2. Primary Entity Decision

Hybrid model: Person + LocalBusiness, connected as two nodes — not collapsed into one type. A profile always carries individual data (bio, experience, portrait) and business-like data (address, hours, service catalog); dropping either would lose real information. Kept the existing `["BeautySalon", "LocalBusiness"]` type as-is — not swapped for a different type "because it sounds better."

3. Canonical Entity @id Strategy

Entity	@id
Business	<code>https://beautyfolio.in/portfolio/{slug}#business</code>
Person	<code>https://beautyfolio.in/portfolio/{slug}#person</code>

Every service `provider`, every media `creator`, and the mutual `founder / worksFor` link reference these two ids — no entity is duplicated inline anywhere in the graph.

4–5. Files Changed & Database Changes

File	Change
seo-helpers.ts	Added buildSameAs() , computeAggregateRating() , buildOfferPricing() , 2 new readiness checks
portfolio.ts / portfolio-mapper.ts	Carry businessName / sameAs /raw price fields through
portfolio.\$slug.tsx	Rebuilt JSON-LD into one @graph ; fixed rating + price bugs
index.tsx	Homepage canonical/og:url now absolute
seo.server.ts / dashboard.seo.tsx	"Related portfolio context" UI

Database changes: none. Every field used already existed.

6–7. Services & Packages — Price Semantics Fixed

Previously: `Offer.price` was regex-stripped from a formatted display string — "Custom quote" produced an empty price; "From ₹5,000" was asserted as a single fixed price. Now:

price_type	Structured data
fixed	<code>Offer.price</code> + <code>priceCurrency</code>
starting_from	<code>Offer.priceSpecification.minPrice</code> (never a fixed price)
custom_quote	No Offer emitted at all — page content unchanged, only the fake price is removed

Packages reuse the identical builder rather than a separate `OfferCatalog` — same real name/description/price shape, no new schema type needed. Documented decision, not forced structure.

8. Review / AggregateRating — Before & After

BEFORE THIS PHASE

```
{"ratingValue": 4.9, "reviewCount": 214}
```

Static column, unrelated to real reviews.

AFTER THIS PHASE

```
{"ratingValue": 4.7, "reviewCount": 3}
```

Matches the 3 real published reviews (avg of 4, 5, 5), live-verified.

Visible marketing copy on the public hero ("600+ clients" etc.) was **not** changed — only the structured-data claim, which search engines can cross-check against the visible reviews, was corrected.

9–13. FAQ / Media / sameAs / Opening Hours / Primary Service

- **FAQ:** already correctly scoped to published rows — no code change needed
- **Media:** `ImageObject` / `VideoObject.creator` now reference the Person `@id` instead of a duplicate inline object; no keyword-based service inference added, as instructed
- **sameAs:** validates real Instagram/Facebook/YouTube/website URLs only — live-verified correctly omitted on a profile with none entered
- **Opening hours:** unchanged, now lives inside the graph
- **Primary service:** unchanged single deterministic rule (featured → first active → null)

14. SEO Readiness Changes

Added **"Valid social link added"** (recommended) and **"Video content present"** (enhancement) — same deterministic weighting as every existing check, no score inflation.

15. Trust-Metric Audit Findings

Metric	Classification	Action
<code>rating</code> / <code>review_count</code>	Not reconciled with real reviews — no dashboard field, no sync trigger found	Removed from structured data; flagged for product cleanup
<code>client_count</code>	Read-only everywhere, no write path found	Was never in structured data; same product-cleanup flag applies to its hero display

<code>years_experience</code>	Database-backed, user-entered	Legitimate, not touched
Reviews, Services/Packages pricing	Database-backed, real rows	Used as-is / with corrected semantics

16. Semantic HTML Findings

Audited: exactly one `<h1>` (hero, professional's name), consistent `<h2>` section headings, reasonable `<h3>` card titles. Already correct — no change made.

17. Final JSON-LD Graph — Live Verified

One `<script type="application/ld+json">` with `{ "@context": "...", "@graph": [...] }` . Fetched raw SSR output for `/portfolio/dharti-panchal` and confirmed:

- `BeautySalon+LocalBusiness` `#business`, `Person` `#person` — cross-referenced via `founder/worksFor`
- `FAQPage` , `BreadcrumbList`
- 5× `ImageObject` , 3× `VideoObject` — creator referencing `#person`
- 8 `Offer` entries (5 services + 3 packages) — correct price semantics per type

18–19. Performance & RLS/Multi-Tenancy

No new query added — every field was already fetched by the existing single-batch query. No new write path — every newly-surfaced field is a column on the same already-profile-scoped table, protected by the same existing RLS.

20. Homepage Canonical Fix

Canonical, `og:url` , and JSON-LD `url` were relative (`"/"`) — now absolute via `absoluteUrl()` . Live-verified: both render as `https://beautyfolio.in/` .

21. Automated Tests

- `tsc --noEmit` — clean
- ESLint — clean
- Production build — succeeds
- 13 routes smoke-tested (`/`, `portfolio`, all dashboard SEO-adjacent pages, `sitemap`, `robots`) — all 200 OK

22. Manual Tests For You To Perform

- Add an Instagram or website URL on your Profile page, confirm `sameAs` appears on the `Person` node
- Add a "Contact for quote" service, confirm it does **not** appear in `makesOffer` while still showing normally on the public Services section
- Review the new "Related portfolio context" chips on `/dashboard/seo` for accuracy

23. Known Limitations

- `client_count` / `rating` / `review_count` remain unaddressed at the product level (still shown as marketing copy in the public hero) — flagged, not fixed, per "don't silently overwrite user content"
- Person node omits phone/email (kept only on Business) to avoid duplicating public contact info across two entities

24. Recommended Next SEO Phase

Address the `rating` / `review_count` / `client_count` trust-metric gap at the product level (real-time sync trigger from `reviews` , or remove the unverified figures) — a data-integrity fix, not a new SEO feature, explicitly out of scope for this phase.
