

BEAUTYFOLIO · PHASE 3F.3A

Public Trust Metric Data Integrity

Fixes the product-level counterpart of the Phase 3F.3 structured-data correction — every quantitative claim on the public portfolio now has a defined, trustworthy source, or is removed. Zero database changes.

Module	Database changes	Scope
Trust Metrics	None	Public UI only

3

METRICS CORRECTED/REMOVED

SCHEMA CHANGES

4

FILES CHANGED

1

NEW SIGNAL ADDED (VERIFIED BADGE)

1. All Trust Metrics Discovered

Metric	Where shown (before)	Value (before, live)
Rating	Hero chip, About stat, Reviews header, trust bar	4.9 (static column)
Review count	Hero chip (misabeled "clients"), Reviews header	214 (static column)
Client count	About "Brides" stat, trust bar "Clients" chip	600+ (static column)
Years of experience	Hero, About, trust bar	8+ years — already consistent
Verified status	Nowhere — no badge existed	n/a

No footer trust metrics found. `/dashboard/seo` confirmed to never display any of these numbers — no inconsistency there.

2. Source-of-Truth Matrix

Metric	Classification	Source
Rating	System-calculated	Average of published <code>reviews.rating</code> — same helper as JSON-LD
Review count	System-calculated	Count of published reviews
Published work count	System-calculated	Count of published <code>portfolio_items</code> — new, replaces "Brides"
Years of experience	User-entered	<code>beautician_profiles.years_experience</code> , dashboard-editable
Verified badge	Admin-managed	<code>is_verified</code> , toggled only in <code>/admin/profiles</code> , audit-logged
Client count	Not reliable enough	No dashboard field, no admin verification, no sync mechanism found

`metrics_verified` column: confirmed via the Phase 1 admin migration's own comment to gate only the original *demo profile's* stat display — unrelated to real professional verification, never set `true` anywhere in current app code, not repurposed.

8. client_count — Audit & Decision: CASE B

Question	Finding
Where did it come from?	Seed/demo data — a migration-era comment confirms <code>600</code> was a known-good <i>demo profile</i> value
User-editable?	No — no field anywhere in <code>dashboard.profile.tsx</code>
Admin-verifiable?	No — read-only display in <code>/admin/profiles</code> , no edit/verify action
Sync logic?	None found
Historical client data?	None — CRM only covers BeautyFolio-era enquiries, not full career history
CRM-derived alternative?	Deliberately not used, per instruction — would misrepresent partial data as complete history

Decision: CASE B — removed from all public trust-metric display. No new dashboard field was added to "preserve" it, per the explicit instruction not to add an input just to keep a legacy metric alive. Replaced with a real, system-calculated signal: published portfolio-work count.

5–7. Rating / Review Count / Zero-Review Behavior

BEFORE THIS PHASE

Hero: 4.9 (214+ clients)
Reviews header: 4.9 / out of 5 , always rendered
About "Brides" stat: 600+

AFTER THIS PHASE — LIVE-VERIFIED

Hero: 4.7 (3 reviews) , hidden if zero
Reviews header: 4.7 / 3 reviews , section hidden if zero
About stat: Published looks (real count)

Both use the exact same `computeAggregateRating()` helper introduced in Phase 3F.3 for JSON-LD — one shared calculation, never two implementations that could drift. Zero-review profiles get no fabricated 0.0★: the rating chip is omitted, the About rating cell is omitted, and `ReviewsSection` now returns `null` entirely (same convention already used by the existing empty-state `VideosSection`).

9–10. Years of Experience & Verified Badge

- Years of experience:** all three locations (hero, About, trust bar) already read one shared `profile.experience` field — confirmed already consistent, not touched.
- Verified badge:** new, small, restrained — added next to the professional's name in the hero, shown only when `is_verified` is true, with a tooltip reading "Reviewed and approved by BeautyFolio" (deliberately not implying government ID or license verification).

11–14. Hero, Reviews, Structured Data & SEO Dashboard

- Hero layout, CTA hierarchy, portrait, spacing — byte-for-byte unchanged except the two value fixes and the new badge
- Reviews section: zero-guard added; real values confirmed live
- Structured data (Phase 3F.3's fix): confirmed untouched and still correct — no code change was needed
- `/dashboard/seo` : confirmed it never displayed these metrics — no inconsistency existed

15. Legacy/Deprecated Fields

Column	Classification	Disposition
rating	LEGACY	No longer read by public UI or structured data
review_count	LEGACY	Same
client_count	UNVERIFIED	No longer public; still read-only in internal admin view
metrics_verified	DEPRECATED	Confirmed unrelated; not repurposed; not read anywhere

No column dropped, per the phase's explicit "expected database schema changes: NONE."

16–17. Tests & Regression

Live-fetched the raw SSR response for `/portfolio/dharti-panchal` and confirmed byte-for-byte: hero chip `4.7 (3 reviews)` , Verified badge present, About "Published looks" + "Average rating" cells present, Reviews header `4.7 / 3 reviews` , trust bar with no "Clients" entry, JSON-LD `aggregateRating {ratingValue: 4.7, reviewCount: 3}` — and confirmed the old `214 / 600+` values are completely gone from the response.

- `tsc --noEmit` — clean
- ESLint — clean (one pre-existing, unrelated warning)
- Production build — succeeds
- 9 routes smoke-tested — all 200 OK

18. Manual Tests For You To Perform

Test A (3 published reviews → 4.7/3 everywhere) was verified directly against live SSR output. These need your dashboard session:

- Unpublish one review — confirm rating/count recalculate everywhere
- A zero-review profile — confirm no rating chip, no About rating cell, entire Reviews section absent
- Change years of experience — confirm every public location updates
- Toggle `is_verified` in `/admin/profiles` — confirm the badge appears/disappears
- Refresh / log out / log in — confirm no inconsistency

19–20. Known Limitations & Recommended Next Phase

- `client_count` remains visible read-only in the internal `/admin/profiles` view — an admin tool reading raw stored values, not a public trust claim, intentionally left as-is
- No dashboard field was added for "approximate clients served" — per instruction not to add an input just to preserve a legacy metric

No next phase proposed — this phase intentionally stops for manual review, per the stop condition.
