

BEAUTYFOLIO · PHASE 3F.4

Local SEO Landing Architecture + Scalable Service URL Strategy

Lets individual professionals rank for high-intent service + location searches (e.g. "Bridal Makeup Artist in Ahmedabad") through one clean, professional-owned URL per service — without thin, duplicate, or doorway pages.

Module	URL pattern	Area × service pages
Service SEO	/portfolio/{slug}/services/{slug}	None built

ONE PROFESSIONAL + ONE SERVICE = AT MOST ONE INDEXABLE SERVICE LANDING PAGE

Service areas enrich that one page — they generate zero additional URLs.

SERVICES INDEXABLE, LIVE-VERIFIED

1. Existing Service Architecture Discovered

`services.slug` already existed but was never written to (always NULL, no constraint). Two genuine but unpopulated FK relationships found: `portfolio_items.service_id` and `before_after_items.service_id` → `services.id`, plus an unused `package_services` junction table. `services.category` and `portfolio_items.category` use incompatible vocabularies — confirming no safe category-based media relationship exists.

Conclusion: a stable SEO URL required a schema change — documented here before implementing, per instruction.

2–3. URL Architecture & Slug Strategy

`/portfolio/{profileSlug}/services/{serviceSlug}`, exactly as specified. Primary city never baked into the URL. Migration adds a format CHECK + per-profile unique index. `createService()` generates a real slug with a retry-on-conflict loop (same pattern as profile-slug generation); `updateService()` never regenerates an existing slug. A computed fallback (`slug ?? slugify(name)`) makes every existing service work today, self-healing into a persisted slug on next dashboard save.

Action needed from you: I could not apply `supabase/migrations/20260823180000_service_slugs.sql` to your live database myself — this environment has no Supabase access token. Please apply it via the CLI or dashboard SQL editor. Everything still works correctly without it (via the computed fallback), just without the database-level uniqueness guarantee.

4–5. Database & Files Changed

One additive migration (touches no existing data). New: `service-page-query.server.ts`, the service-page route, the migration file. Modified: `seo-helpers.ts`, `services.server.ts`, the portfolio mapper/type, `server.ts` (sitemap), `portfolio-sections.tsx`

(internal links), `seo.server.ts` + `dashboard.seo.tsx` (Service Search Pages list), `dashboard.services.tsx` (one-line helper text).

6. Indexability Eligibility Rule

Deterministic, no arbitrary score — noindex unless **all** of: portfolio indexing is on, primary city is set, and the service description is at least 40 characters. The exact same function is shared by the page's own robots directive, the sitemap generator, and the dashboard list, so they can never disagree.

Live-verified on the real test profile: "HD Bridal Makeup" (real description) → `index, follow`, appears in sitemap. "Nail Art" (no description) → `noindex, follow`, page still renders normally, correctly excluded from sitemap.

7–13. Content, Title, Canonical, Breadcrumb, Structured Data

Element	Live-verified value
Title	HD Bridal Makeup Artist in Ahmedabad Dharti R Panchal
Canonical	https://beautyfolio.in/portfolio/dharti-panchal/services/hd-bridal-makeup (self-referencing)
H1	Exactly one — "HD Bridal Makeup Artist in Ahmedabad"
Breadcrumb	BeautyFolio → Dharti R Panchal → Services (no fake URL) → HD Bridal Makeup
JSON-LD @graph	WebPage + Service + Business + Person + BreadcrumbList — Business/Person @id identical to the main portfolio's (Phase 3F.3), no competing entity

14. Pricing Schema — Live-Verified

price_type	Real service	Structured data
fixed	HD Bridal Makeup (₹18,000)	<code>Offer.price: 18000</code>
starting_from	Sider makeup (₹5,000)	<code>priceSpecification.minPrice: 5000</code> — never a fixed price
custom_quote	—	No Offer emitted at all

15–17. Internal Links, Sitemap, SEO Dashboard

- Every service card on the main portfolio now links to its service page (title + a "View service" button) — existing "Enquire" CTA and card layout untouched
- Sitemap includes only eligible services — live-verified 3 of 5 real services included, matching the indexability rule exactly
- New "Service Search Pages" card on </dashboard/seo> — ✓/⚠ status per service with the exact required wording, no "will rank"/"Google approved" language

18–19. Duplicate-Content & Thin-Page Safeguards

- Bio, all reviews, all FAQs, all gallery, all service areas — never copied wholesale onto a service page
- Reviews: only a general professional-level trust summary shown (no reliable per-review service link exists)
- FAQs: linked back to the portfolio's own section instead of duplicated
- Packages: omitted entirely — the junction table exists but has zero real data, so no relationship could be safely used

20–21. RLS & SSR/Performance

Same anon/RLS-scoped client as every other public read — never the service-role key. Live-verified: an invalid profile/service slug combination 404s, never leaking another profile's data. Every SEO-relevant element (title, meta, canonical, robots, H1, breadcrumbs, JSON-LD) confirmed present in raw SSR output via direct `curl`, not client hydration. Queries batched via `Promise.all`, no N+1.

22. Automated Tests

- `tsc --noEmit` — clean
- ESLint — clean
- Production build — succeeds
- 9 routes smoke-tested — all 200 OK (or correct 404 for invalid-slug cases)

23. Manual Tests For You To Perform

1. Deactivate a service — confirm its page is no longer publicly reachable
2. Turn off "Allow search engines to show my portfolio" in `/dashboard/seo` — confirm all that profile's service pages go noindex and drop from the sitemap
3. Apply the migration listed above

24. Known Limitations

- "Relevant portfolio work" renders empty for every current service — the relationship is real but has no dashboard write path yet (documented, not a bug)
- Migration not yet applied to the live database (no credentials available in this environment)

25. Recommended Next Phase

Not started: a dashboard UI to let a beautician link a gallery/before-after item to a specific service, activating the already-real `service_id` relationship so "Relevant portfolio work" starts showing real content with zero further changes to the service page itself.
