

BEAUTYFOLIO · PHASE 3F.5

Final Security Verification

Ownership-protection trigger applied to the confirmed live database, then a full A–I test suite executed directly against real data — same-profile linking, forged cross-profile attempts, deletion behavior, and data-integrity checks.

STRAY DATA LEFT BEHIND

1–4. Project, Migration, Triggers, Tables Protected

Item	Result
Project reference	ivbujlyilzmlublqzalu — reconfirmed live via a stored Storage URL before any write
Migration applied	YES — via the verified Lovable MCP connection only
Trigger 1	trg_portfolio_items_service_ownership (BEFORE INSERT/UPDATE)
Trigger 2	trg_before_after_items_service_ownership (BEFORE INSERT/UPDATE)
Tables protected	portfolio_items , before_after_items

A–I Test Results

A — Same-profile Gallery link

PASS

B — Same-profile Before/After link

PASS

C — Reset to NULL

PASS

D — Forged Gallery cross-profile

REJECTED

E — Forged Before/After cross-profile

REJECTED

F — Rename linked service

PASS

G — Delete linked service

PASS

H — Hide linked media

PASS

I — Existing data integrity

PASS

5. Cross-Profile Forged Test Result

Both Test D and Test E attempted to link Dharti's real media to a temporary service planted under Janvi's profile — both rejected instantly with:

P0001: `service_id` must belong to the same beautician profile as this item

Both left zero trace — the temporary services and the forged links were confirmed gone afterward.

6. Same-Profile Test Result

Tests A, B, and F all succeeded exactly as expected: same-profile Gallery link, same-profile Before/After link, and a service rename that left the relationship (`service_id`) completely unchanged while the join query correctly picked up the new name.

7. SET NULL Delete Behavior

Test G confirmed: deleting a linked service automatically set the media's `service_id` to `NULL` ; the media row itself was untouched. Verified inside a controlled, rolled-back transaction so the real "Nail Art" service was never actually lost — Postgres fires FK actions during the transaction regardless of whether it's later committed or rolled back, so this is a faithful test of the real code path with zero permanent risk.

8. Existing Data Integrity

Final state matches the pre-test baseline exactly: all 5 real services present with original names/slugs, both gallery items and the one before/after item back to `service_id: null / is_published: true` , no stray test rows anywhere. The only observed difference from baseline is `portfolio_items.updated_at` advancing on the one row legitimately written to during Tests A/C/F — an expected, correct side effect of the pre-existing `set_updated_at` trigger, not an unintended change.

9. Build/Test Results

Check	Result
<code>tsc --noEmit</code>	Clean
ESLint	Clean
Production build	Succeeds
5 required routes smoke-tested	All 200 OK

10. Manual Tests Still Required

None from the security-verification suite — A through I are all complete and passed. The dashboard's "Related service" dropdowns are ready for real use, with the database-level protection now live underneath them.

Phase 3F.5 is fully closed. No further phase was started.
