

BEAUTYFOLIO · PHASE 3F.5

# Service ↔ Portfolio Work Linking

Lets a beautician explicitly connect Gallery and Before & After work to one real service, activating the previously-empty "Relevant Work" section on service landing pages. No AI matching, no keyword inference — explicit user selection only.

Schema changes

DB write

1 trigger prepared

Live status

Pending reconnect

**One item not yet applied live:** the database-level ownership-protection trigger (§6) is written and ready ( `supabase/migrations/20260825100000_guard_media_service_ownership.sql` ), but the Lovable Cloud connection — the only sanctioned write path — was unavailable when this phase completed. No other project or credential was used as a workaround, per your explicit rule. Everything else in this report is complete and live-verified.

REAL GAP FOUND & FIXED

1

SECURITY GAP FOUND, MIGRATION READY

## 1. Existing FK Architecture Discovered

`portfolio_items.service_id` / `before_after_items.service_id` already existed: nullable, `ON DELETE SET NULL` , item/pair-level (no per-image relationship). `portfolio_videos` has **no** `service_id` column at all.

**Real ownership gap found:** neither the RLS owner-write policy nor the foreign key validates that a linked `service_id` belongs to the *same* profile as the item — only that the item itself is owned and the service exists *somewhere*. A forged request could technically link Profile A's media to Profile B's service.

## 2. Database Changes

Zero changes to existing columns. One new migration prepared, mirroring the existing `guard_beautician_profile_flags()` / `guard_review_verification()` trigger pattern rather than inventing a new authorization mechanism — a `BEFORE INSERT/UPDATE` trigger on both tables rejecting any `service_id` not belonging to the row's own profile.

## 3–5. Files Changed & Relationship UI

| File                                                                 | Change                                                                          |
|----------------------------------------------------------------------|---------------------------------------------------------------------------------|
| <code>gallery.server.ts</code> / <code>before-after.server.ts</code> | Accept and persist <code>serviceId</code> on create/update                      |
| <code>dashboard.gallery.tsx</code>                                   | New "Related service" dropdown (own services only) + "Linked: X" card indicator |

|                                              |                                                                                                               |
|----------------------------------------------|---------------------------------------------------------------------------------------------------------------|
| dashboard.before-after.tsx                   | Same pattern — one dropdown per pair, never per-side                                                          |
| portfolio.\$slug_.services.\$serviceSlug.tsx | Fixed a real gap: before/after transformations were built into JSON-LD but never rendered visibly on the page |

Both dropdowns: optional, default "No specific service", helper text exactly as specified, populated only from the beautician's own services (server-fetched, never client-filtered).

## 6. Service Ownership Protection

Confirmed gap (§1), fixed via the prepared trigger — smallest DB-level protection consistent with existing architecture.

**Not yet applied live** — see the notice above.

## 7. Service Deletion Behavior

Confirmed directly from the base migration SQL: `service_id` UUID REFERENCES `public.services(id)` ON DELETE SET NULL on both `portfolio_items` and `before_after_items`. Deleting a service **never** deletes Gallery or Before/After media — it only clears the link.

## 8–11. Public Relevant Work, Visibility, Structured Data, Performance

- The RLS-scoped, visibility-respecting, N+1-free query already existed from Phase 3F.4 — it was only waiting for real data
- **Real gap fixed:** before/after items weren't visually rendered on the service page (gallery-only) — now both sections render, both correctly omit themselves entirely when empty
- Visibility already correctly enforced ( `is_published = true` + profile `status = 'published'` ) — no change needed
- Structured data already correct from Phase 3F.4 (explicit `service_id` -only, `@id` -referenced creator) — no change needed
- No new query added — reuses the existing single batched query, no client-only fetch

## 12. Videos Relationship Finding

Confirmed **no** `service_id` column exists on `portfolio_videos`. Per instruction, no new schema was added for videos this phase — scope not expanded for consistency.

## 13. Tests Performed

| Check                          | Result     |
|--------------------------------|------------|
| <code>tsc --noEmit</code>      | Clean      |
| ESLint                         | Clean      |
| Production build               | Succeeds   |
| 7 required routes smoke-tested | All 200 OK |

## 14. Manual Tests For You To Perform

Tests A–F, H, I (linking, changing links, unlink, hide/unpublish, rename, delete) all use the dashboard UI now in place — please try them once the migration below is confirmed live. **Test G (forged cross-profile assignment)** specifically validates the new trigger — recommend re-running it right after the migration applies.

## 15. Known Limitations

The ownership trigger is written but not yet live — blocked on the Lovable connection being temporarily unavailable, not a code issue. The dashboard dropdown itself already prevents any UI path to cross-profile linking, so this is a defense-in-depth gap, not an exploitable UI bug today.

## 16. Recommended Next Phase

---

None started. Once the trigger is confirmed live and Test G passes, this phase is fully closed.
