Duration Data Integrity Check

Audit of "Typical duration: 60 mins" on the public service page — is it a genuine stored value, or a hardcoded/defaulted claim? No code changed; the field is genuine, but a real dashboard-form risk was found and flagged.

Code changed	Field	Verdict
None	services.duration_minutes	Genuine, kept — risk flagged

1–3. Source, User-Entered, Hardcoded?

Question	Answer
Which field supplies it?	<code>services.duration_minutes</code> — real column, base migration, <code>CHECK (duration_minutes > 0)</code>
User-entered real data?	YES — editable in <code>/dashboard/services</code> , service-scoped
Hardcoded on the public page?	NO — reads the column verbatim, no fallback, only renders when the value exists

Live Data — All 5 of Dharti's Services

Service	duration_minutes	Assessment
HD Bridal Makeup	180	Clearly deliberate
Airbrush Bridal Makeup	210	Clearly deliberate
Party & Sangeet Makeup	90	Clearly deliberate
Nail Art	60	Ambiguous — matches the form's default exactly
Sider makeup	60	Ambiguous — matches the form's default exactly

Real risk found (adjacent to the display, not on it): `dashboard.services.tsx` lines 114 and 161 silently pre-fill/default duration to **60** both for a brand-new service and when editing an existing service whose stored value is `null`. A beautician could save "60 minutes" without ever deliberately choosing it. Live data shows exactly 2 of 5 services at precisely 60 — the other 3 are clearly deliberate, non-default values. This can't be resolved from stored data alone.

Decision

Per the stated rule, a genuine stored, user-editable, service-scoped field is **kept, not removed**. This is a dashboard **form-default risk**, not a public-page fabrication — the page itself never guesses or falls back. Fixing the form's silent default is a separate, more invasive change (no new field, no redesign, out of scope for this audit).

Other Service-Page Facts Checked

- Price — real, correct fixed/starting-from/quote semantics
- Appointment type — real, from `availability_settings` , `null` when unset, no fallback claim
- Rating/reviews — computed live from real published rows
- Service areas, "Other services" — all real, service/profile-scoped queries

No other hardcoded/defaulted facts found.

Outcome

- **No code changed** — duration display kept as-is
- SEO metadata and structured data untouched
- No new database field added

Flag For You

Consider a future small fix to `dashboard.services.tsx` so a new/edited service's duration field starts empty rather than pre-filled with 60 — that removes the ambiguity at the source instead of on the display side.
