

BEAUTYFOLIO · PHASE 3F.6

Service Page Content Depth + Conversion Optimization

Deepens every service landing page with real trust signals, real appointment context, and real internal links — while fixing a genuine conversion gap: service context was being lost the moment a visitor clicked "Check availability." Zero database schema changes.

1–2. Audit & Conversion Weaknesses Found

Present already: breadcrumb, H1, provider line + verified badge, city, top CTAs, description, pricing, service areas, relevant gallery, before/after, aggregate trust stat, FAQ link-out, back-link block. Missing/weak: appointment-type/travel info despite real data existing; no "Other services" internal links; no bottom-of-page CTA; no mobile sticky CTA on this route; reviews heading conflated bio wording with trust data; hero showed no rating/experience/price summary.

Biggest conversion weakness found: the "Check availability" CTA left the service page and dropped into the main portfolio's generic form with **zero service context carried over** — the customer had to re-select the exact service they'd just come from.

3–4. Files Changed & Database Changes

File	Change
service-page-query.server.ts	Bundle now carries otherServices , appointmentType , travelAvailable — all from already-fetched queries
portfolio.\$slug_.services.\$serviceSlug.tsx	Hero chips, appointment info, review snippets, Other services, final CTA, mobile sticky CTA, service-context search param
portfolio.\$slug_.tsx	validateSearch for ?service= , passed to AvailabilitySection
portfolio-sections.tsx	AvailabilitySection accepts prefill, passes real _service_id to submit_lead
portfolio.ts / portfolio-mapper.ts	Added id to ServiceItem

Database changes: zero, confirmed. submit_lead 's _service_id parameter and leads.service_id FK already existed from the base migration — they simply weren't being passed from the client.

9. Service Context → Lead-Flow Finding (Real Gap, Fixed)

The form already sent `_service_requested` (free text) but never `_service_id`, even though the RPC and FK already supported it. Now resolves the selected service to its real `id` and passes both — giving leads a genuine relational link instead of only a text label. Zero schema changes required.

5–8. Architecture, Hero, Pricing, CTAs

- New page order: Breadcrumb → Hero (+ trust chips) → CTAs → Overview → Pricing/booking context → Relevant work → Before/After → Client reviews → FAQ link-out → Other services → Professional summary → Final CTA → mobile sticky bar
- Hero: compact real-data chip row (rating+count, years of experience) — only when they exist, never every stat at once
- Pricing: unchanged Phase 3F.3 semantics — live-verified `HD Bridal Makeup` (fixed) → `{"price":18000,"priceCurrency":"INR"}` in structured data, `₹18,000` visible, fully consistent
- CTAs: primary/secondary hierarchy preserved, now carries `?service={name}` into the main portfolio's Availability form

10–14. Relevant Work, Reviews, FAQ, Service Areas

Gallery/Before-After rendering logic unchanged (already correct from Phase 3F.5). Reviews heading corrected from "About {name}" to "Client reviews for {name}" — up to 2 real review quotes now shown when reviews exist.

Live-verified empty-state confirmation: Dharti's 3 reviews are currently all unpublished — the reviews section correctly and cleanly omits itself. This is real proof the empty-state rule works, not a bug to fix.

FAQs: confirmed no `service_id` column exists — link-out preserved, no duplication. Service areas: appointment type/travel now surfaced as one concise real-data line (e.g. "Studio & client-location appointments"), never exposing raw config values.

15–18. Provider Summary, Related Services, Packages, Mobile CTA

- Provider summary: existing back-link block kept, unchanged in scope
- New "Other services by {name}" section — up to 4 real active services, current one excluded
- Packages: `package_services` re-verified live at 0 rows — correctly omitted from service pages
- New mobile sticky CTA on this route, matching the existing `MobileStickyCta` visual pattern exactly (not directly reused — needed cross-page navigation with service context)

19–22. Structured Data, SSR, Performance, Indexability

Structured data: no change. Live-verified the JSON-LD `@graph` still contains exactly the same 5 node types as before (`WebPage`, `Service`, `BeautySalon+LocalBusiness`, `Person`, `BreadcrumbList`) — no schema added just because new visual sections exist.

SSR: raw HTML confirmed title, meta description, canonical, `robots: index, follow`, exactly one H1, all new sections — nothing hydration-dependent. **Performance:** no new query added — new bundle fields all come from already-fetched queries. **Indexability:** `evaluateServiceIndexability()` untouched.

23. Automated Tests

Check	Result
tsc --noEmit	Clean
ESLint	Clean (1 pre-existing unrelated warning)
Production build	Succeeds
11 required routes	All 200 OK

24–26. Manual Tests, Limitations, Next Phase

Test G (availability CTA carries service context) and Test H (WhatsApp) are ready to click through live. To see the full reviews section, publish at least one of Dharti's 3 reviews via `/dashboard/reviews` first — all 3 are currently unpublished (real data state, not a defect).

Known limitations: reviews section can't currently be visually verified end-to-end since no review is published right now. "What's included"/duration-detail/prep info remains correctly omitted — no such fields exist in the schema.

Recommended next phase: possible future dashboard fields for services (duration, what's included, add-ons) if richer service-detail content is wanted — not added this phase since the schema doesn't support them yet.
