

BEAUTYFOLIO · PHASE 3F.8

Service Content Quality + Publishing Readiness

A single shared, deterministic readiness helper across the dashboard, SEO page, and public routes — no arbitrary score, three plain states, save/publish/search kept as three distinct concepts. Zero database schema changes; found and closed a real gap: no UI existed to unpublish a service.

Schema changes	New write path	Score shown
0	is_active (Show on portfolio)	None — 3 states only

ROUTES SMOKE-TESTED OK

1–2. Existing Audit & Save/Publish/Search Model

Read every relevant file before coding. Found robust save validation (Phase 3F.6 price/duration integrity) enforced only in the browser — no server-side check existed. `evaluateServiceIndexability()` was already the single source of truth for robots/sitemap. The SEO dashboard's service list silently dropped inactive services. Most notably: **no UI anywhere let a beautician unpublish a service** — `services.is_active` was a real, RLS-covered column with zero write path.

SAVE VALIDATION

Does the data satisfy business rules?
e.g. fixed price needs a positive number.

PUBLICATION

Is the service active + visible on the portfolio? Independent of search quality.

SEARCH READINESS

Does the page have enough real content to justify index, follow?

3–4. Files Changed & Database Changes

File	Change
<code>lib/service-limits.ts</code> (new)	Shared client+server thresholds — 12 list items, 1000-char prep notes
<code>lib/seo-helpers.ts</code>	<code>evaluateServiceIndexability</code> gains <code>hasPersistedSlug</code> ; new <code>evaluateServiceContentReadiness()</code> + label helpers
<code>services.server.ts</code>	<code>is_active</code> added to <code>ServiceInput</code> ; server-side <code>validateServiceContent</code> ; batched <code>listOwnServicesWithReadiness</code>
<code>seo.server.ts</code>	<code>servicePages</code> uses the shared readiness function, now includes inactive services
<code>dashboard.services.tsx</code>	<code>is_active</code> toggle, readiness panel, char count, guidance text, list caps
<code>dashboard.seo.tsx</code>	3-state service list rendering

Database changes: zero, confirmed. `is_active` already existed with a `true` default and full RLS coverage — this phase only added its first write path.

5–6. Shared Readiness Logic & Description Quality

One function, `evaluateServiceContentReadiness()`, used identically by `/dashboard/services`, `/dashboard/seo`, and (via the unchanged `evaluateServiceIndexability()` it wraps) the public route's robots directive and the sitemap. Live-verified: real "HD Bridal Makeup" stayed `index`, `follow` and `sitemap-included` after the slug-persistence check was added.

The existing 40-character description threshold was preserved exactly (internal only, never shown as a number to the user). Verified against real production data: Nail Art (0 chars) and Sider makeup (1 char) correctly fail; Airbrush/Party & Sangeet/HD Bridal (65–75 chars) correctly pass.

7–8. List/Preparation Validation & Silent-Default Audit

Added a 12-item cap for What's Included / Suitable For and a 1000-character cap for preparation notes — enforced identically client-side (disabled "+ Add item" past 12) and server-side (throws). Confirmed real user-entered content ("Hd make up", "Pls wash you hair before 4 hours for dry") is preserved verbatim — no rewriting, no grammar correction. Price/duration silent-default protections from Phase 3F.6 remain untouched.

9–11. Dashboard UX — Cards, Edit Dialog, SEO Page

- Service cards: compact readiness badge ("Ready for search" / "Needs details" / "Not indexed"), "Hidden" badge when inactive, up to 2 top reasons when not ready
- Edit dialog: new "Service page readiness" panel — Required and Recommended checklists visually separated, "Ready" or "Needs N required improvements" summary, Profile deep-link when city is missing
- SEO dashboard: "Service Search Pages" now lists every service including unpublished ones, using the same 3-state label

12–13. Public/Indexability Behavior & Sitemap Consistency

Live-verified end-to-end: toggling Nail Art's `is_active` off removed it from `/sitemap.xml` and its direct URL returned 404 immediately; toggling back on restored both (200, sitemap entry present) — confirming dashboard, robots, and sitemap can never disagree.

14–17. Regression, Profile Guidance, RLS, Performance

Price/duration: server-side `validateServiceContent` now mirrors the client rules exactly, closing a real gap where only the browser enforced them. **Profile dependency:** a missing-city readiness failure links directly to `/dashboard/profile`. **RLS:** no new ownership model — the batched readiness query composes only existing owner-scoped functions. **Performance:** confirmed no N+1 — 6 fixed batched queries per `/dashboard/services` load regardless of service count.

18. Automated Tests

Check	Result
<code>tsc --noEmit</code>	Clean
ESLint	Clean (1 prettier auto-fix pass)
Production build	Succeeds
7 required routes	All 200 OK

19–21. Manual Tests, Limitations, Next Phase

Manual tests performed: description-length pass/fail against real production services, is_active toggle → 404 + sitemap exclusion → revert → restored, robots directive unaffected by the new slug-persistence check.

Known limitation: server-side price/duration blocking (TEST F/G) was verified by code review, not a live authenticated HTTP call — no browser session was available in this environment. The server logic is a direct mirror of the already-proven client zod rules.

Recommended next phase: none proposed. Per the STOP condition — AI content writing, AI SEO, service × area pages, city directories, marketplace features, blog, Search Console, GBP, rank tracking, production deployment, hosting, and cover-hero A/B testing all remain out of scope. Awaiting manual approval.
