

BEAUTYFOLIO · PHASE 3F.8A.1

Intermittent Gallery + Before/After Route Failure — Root-Cause Fix

A real, reproducible runtime regression traced to its exact origin: a React Query cache-key collision introduced by Phase 3F.8, not an auth/session or media-data problem. Fixed at the root with distinct cache keys, plus defensive hardening so the same bug class can't recur.

ROUTES SMOKE-TESTED
OK

1. Exact Runtime Error

`TypeError: services.map is not a function` — thrown synchronously inside `GalleryPage` 's (and `BeforeAfterPage` 's) render body, at the "Related service" dropdown code. An uncaught render-time exception, caught by TanStack Router's route error boundary and shown as the generic **"This page didn't load. Something went wrong on our end."**

2. Reproduction Sequence

- 1 Visit `/dashboard/gallery` or `/dashboard/before-after` first in a session → works.
- 2 Visit `/dashboard/services` at any point afterward → still works (that page reads its data defensively).
- 3 Navigate back to Gallery or Before/After → crashes.
- 4 A hard reload / fresh tab "fixes" it temporarily by starting the sequence over.

3–4. Root Cause & Why Login Temporarily Fixed It

`router.tsx` creates exactly **one shared `QueryClient`** for the entire SPA session. Three independent route files — `Gallery`, `Before/After`, `Services` — each declared their own `listServicesFn` but cached it under the **identical literal key** `["own-services"]`. Until Phase 3F.8, all three returned the same flat-array shape. Phase 3F.8 repointed the `Services` page's query at `listOwnServicesWithReadiness()`, returning `{ services, readinessContext }` — an object, not an array — without renamespacing its key. Once the `Services` page populated that shared slot with the object shape, `Gallery/Before-After`'s next render called `.map()` directly on it.

Why login "fixed" it: a hard reload re-executes `getRouter()`, creating a brand-new, empty `QueryClient` — wiping the poisoned cache entry until the `Services` page is visited again in the fresh session.

5. Why Gallery and Before/After Were Affected

They're the only two routes that both (a) read the shared `"own-services"` key for their "Related service" dropdown and (b) call `.map()` / `.find()` on the result unconditionally during render, with no shape guard. The Services page's own optional chaining happened to absorb a wrong-shaped value without crashing — which is exactly why it looked "unaffected."

6–7. Files Changed & Database Changes

File	Change
dashboard.gallery.tsx	Query key renamed to ["own-services-for-linking"] ; Array.isArray() guard added
dashboard.before-after.tsx	Same key rename (intentionally shared with Gallery — same shape); same guard added
dashboard.services.tsx	Query key renamed to ["own-services-with-readiness"] , used consistently by its query and both invalidations

Database changes: zero, confirmed. This was a pure client-side cache-key bug. Live-verified via Lovable MCP: both `trg_portfolio_items_service_ownership` and `trg_before_after_items_service_ownership` remain present and enabled, untouched.

8. Auth/Session Fix

None needed. `requireSupabaseAuth` was read in full and is identical, per-request, and stateless across every dashboard route — confirmed never the cause, and nothing about it changed. This was never an auth/session-lifecycle bug despite superficially resembling one.

9–11. Gallery, Before/After & Related-Service Results

- Gallery: query key no longer collides; `.map()` now always operates on a guaranteed array; add/edit/delete, multiple images, visibility, alt text, Related service, dropzone all untouched
- Before/After: identical fix; add/edit/delete, before/after images, visibility, descriptions, Related service, dropzones untouched
- Related service: still fully functional — Gallery and Before/After now share one correctly-shaped cache entry (a minor efficiency bonus), and a future shape mismatch elsewhere can no longer crash either route

12. Storage/Media Integrity

Live-verified via Lovable MCP: Dharti's profile still has 2 gallery items / 3 gallery images / 1 before-after item / 2 before-after images — unchanged from before this fix.

13–14. Navigation & Session Tests

Not performed live — no browser automation tool (Playwright/chromium-cli) is available in this environment. The fix was verified by tracing the exact crash mechanism in code (the single shared `QueryClient`, the exact colliding key, the shape divergence from Phase 3F.8) and eliminating it structurally — the routes can no longer read each other's differently-shaped cache entry, regardless of navigation order or cycle count. The login/logout test wasn't needed to validate this fix either, since the bug was proven independent of auth/session state.

15. Automated Tests

Check	Result
-------	--------

tsc --noEmit	Clean
ESLint	Clean
Production build	Succeeds
8 required routes	All 200 OK

16. Remaining Manual Test For You

Please do the 20-cycle navigation walk (Gallery → Services → Before/After → SEO → Gallery → Profile → Before/After, repeated, with a hard refresh and back/forward mixed in) for a live, empirical confirmation — zero failures expected now. Also worth checking that editing/saving a service on `/dashboard/services` and then immediately opening Gallery's "Add item" dialog shows the updated service list in the Related-service dropdown.

Stopping here per the phase's STOP condition — not starting another phase.
