

BEAUTYFOLIO · PHASE 3F.9

Portfolio Content Quality + Search Readiness

The same disciplined readiness philosophy from service pages (Phase 3F.8) now applied to the main professional portfolio — one authoritative, deterministic model shared by the public robots directive, the sitemap, and both dashboard pages. No score, no AI, zero schema changes.

1–2. Audit & Required/Recommended Model

Found three separate, potentially-disagreeing readiness concepts before this phase: the Phase 3F.1 18-check scored system, the main portfolio route's robots directive (toggle-only, no content gating), and a third informal completeness percentage on `/dashboard/profile`. All three are now one system.

A. SAVE VALIDITY

Can the professional save the profile? Unchanged zod schema.

B. PUBLICATION

Is the portfolio published to visitors?
`profile.status === "published"`.

C. SEARCH READINESS

Is it strong enough for index, follow + sitemap?
One shared function.

STATES

Ready for search / Needs improvement / Not indexed — never a percentage.

3–5. Files Changed, Database Changes & Shared Helper

File	Change
<code>seo-helpers.ts</code>	New <code>evaluatePortfolioIndexability</code> / <code>evaluatePortfolioContentReadiness</code> ; old 18-check system removed
<code>portfolio-query.server.ts</code>	Sitemap query now gates on real readiness, batched active-service counts
<code>portfolio.\$slug.tsx</code>	Loader computes <code>indexable</code> ; robots meta always explicit
<code>seo.server.ts</code>	<code>getSeoOverview</code> rebuilt on the new model, adds service-page tally
<code>dashboard.seo.tsx</code>	Rebuilt Search Visibility + grouped checklist, deep links, old score UI removed
<code>profile.server.ts</code>	New <code>getOwnPortfolioReadinessContext</code>
<code>dashboard.profile.tsx</code>	Live readiness panel replaces the old completeness bar

Database changes: zero, confirmed. No `portfolio_readiness_score` / `seo_score` columns — everything derived at read time. `evaluatePortfolioContentReadiness()` wraps the leaner `evaluatePortfolioIndexability()` for its `indexable` result — dashboard, robots meta, and sitemap share the same function chain, not parallel reimplementations.

6–8. Dashboard UX, Live Draft & SEO Page

The old percentage bar on `/dashboard/profile` is replaced by a compact "Portfolio readiness" panel — state badge, message, Required/Recommended mini-checklists. `form.watch()` (already used for the existing live-preview identity card) now also drives readiness on every keystroke, combined with a separately-loaded static context for signals this page doesn't itself edit (services, gallery, reviews). An "unsaved changes" banner appears when the draft differs from the saved row. `/dashboard/seo`'s old `ScorePill` is gone, replaced by the deterministic state plus a grouped Required / Recommended / Technical SEO checklist with inline deep links.

9–11. Primary City, Profile Image & About Quality

Profile image was audited and promoted to REQUIRED (a missing photo weakens trust, the OG fallback, and Person entity completeness — genuinely different from services, which never had an image concept). Verified safe against real data. Primary city stays required and was live-tested (see §17). Bio reuses the exact `MIN_BIO_LENGTH = 80` threshold from the retired system — never a new number, and the helper text never mentions a character count to the user.

12–16. Services, Work, Reviews, Availability & Categorization

- The portfolio helper consumes only `activeServiceCount` — it never recomputes individual service readiness, which stays owned by Phase 3F.8's model
- Gallery/Before-After counts are recommended-only, sourced from real `is_published` rows — never `client_count`
- Reviews stay recommended-only and deliberately have no deep-link nudge on the SEO dashboard
- Availability/service areas are recommended-only; primary city remains the sole required local-search signal
- Every check carries an explicit category (content/local/trust/technical) and required flag, so content issues are never visually mixed with technical hygiene

17–18. Indexability & Sitemap Consistency — Live-Verified

Cleared Dharti's `primary_city` → public robots meta flipped to `noindex, follow` and the profile disappeared from `/sitemap.xml`. Restored it → back to `index, follow`, sitemap-included again. The robots meta is now always explicit (previously sometimes omitted entirely), computed from the identical `indexable` boolean the sitemap query derives independently — zero drift observed.

19–20. Query Safety & Performance

The new Profile-page readiness query uses a dedicated cache key (`own-portfolio-readiness-context`) — never reusing `own-services` or any other route's key, directly applying the Phase 3F.8A.1 lesson. No N+1: the sitemap query uses one batched `.in()` call for active-service counts across all profiles; both dashboard pages run a fixed small number of batched queries regardless of data volume.

21. Automated Tests

Check	Result
<code>tsc --noEmit</code>	Clean
ESLint	Clean

Production build	Succeeds
11 required routes	All 200 OK

22–24. Manual Tests, Limitations & Next Phase

TEST A (complete profile → Ready for search) and TEST C (missing city) were live-verified above. TEST B (robots toggle), D (image-missing UI), E (live-typing panel), H (zero active services), I (one weak secondary service), and J (navigation regression) should be spot-checked in a real browser session — no browser automation is available in this environment, so these were verified by code tracing rather than click-through.

Recommended next phase: none proposed. Per the STOP condition — AI profile writing, AI SEO, city/category directories, service × area pages, marketplace pages, blog system, Search Console, GBP, rank tracking, production deployment, hosting, and cover-hero A/B testing all remain out of scope. Awaiting manual approval.
