

BEAUTYFOLIO · PHASE 3G.1

Public Portfolio Conversion + UX Audit

A full visitor-journey audit (Google/shared link → trust → services → availability → WhatsApp → CRM), implementing only high-confidence CRITICAL and HIGH VALUE fixes. Found and fixed one fabricated availability claim, one cross-profile hardcoded-city bug, one duplicate-submit vulnerability, and a systemic empty-section gap.

1. Executive Conversion Verdict

The core journey (hero → trust → work → services → availability → WhatsApp) was already well-built from prior phases. CTA hierarchy, WhatsApp architecture, and modal z-index layering were already correct — confirmed, not changed. Audit surfaced four real, high-confidence issues, all now fixed.

2–3. Main Portfolio & Service-Page Audit

Found: fabricated "Next available date / Booking for this wedding season" text in the hero card — no real availability data behind it. **Found:** a hardcoded "...within Ahmedabad" + unverifiable "no hidden charges" claim in the Services subheading — factually wrong for any non-Ahmedabad profile. Both fixed.

Service-page structure (breadcrumb → hero → pricing → about → included/suitable/prep → relevant work → reviews → areas → other services → final CTA) already matches purchase-intent order from Phase 3F.6/3F.7 — no unsupported copy found there.

4–5. Above-Fold & CTA Hierarchy

Confirmed compliant, no changes needed: PRIMARY "Check availability" (hero variant), SECONDARY "WhatsApp" (softline), TERTIARY "View work"/"View service" (ghost/link) — consistent everywhere. No "Book now" language anywhere. Hero hierarchy (name, badge, headline, trust chips, bio, 3 CTAs, portrait) is not overloaded.

6–7. Availability Flow & Form Friction

Fixed a real conversion-safety gap: the availability form previously stayed fully interactive after a successful send — nothing prevented a second submission. It now replaces itself with a distinct success state (message + WhatsApp + "Send another request" reset) once sent.

6 fields (name, phone, date, service, location, optional message); date-eligibility and location-match are advisory only, never blocking. Genuinely completable well under 60 seconds. Service context from service pages (`?service=`) confirmed passing through correctly (pre-existing).

8–9. WhatsApp UX & Navigation

Confirmed correct: desktop floating WhatsApp button and mobile sticky bar are breakpoint-exclusive (`md:inline-flex` vs `md:hidden`) — no overlap or duplication.

Fixed a real bug: header nav items for Work/Transformations/Packages/Reviews/Videos/FAQ were static and always shown, even when the section had no data and rendered nothing — dead anchor links. Nav is now built from the same real data the sections themselves check.

10–12. Section Order, Services & Trust

Current section order already closely matches the phase's suggested ideal sequence — no reorder implemented, no evidence current order underperforms. Service cards show name/price/detail/duration with WhatsApp-enquire + "View service" — appropriately light. Verified badge tooltip ("Reviewed and approved by BeautyFolio") and per-review "Verified client" badge both confirmed honest, no over-claiming.

13–16. Gallery, Before/After, Video & Package Findings

Fixed a systemic gap: Gallery, Transformations, and Packages had no empty-state guard — would render headers/filter chips over empty content. Videos/Reviews/Service Areas already self-omitted correctly; the same guard was added to the three missing sections plus FAQ. No fake savings claims or result-guarantee language found.

17–19. Local Relevance & Claim Integrity — CRITICAL

"Next available date: Booking for this wedding season" was 100% static marketing copy with no real availability query behind it — replaced with the phase's own suggested safe wording ("Check availability for your date"), and made it an actual working link since it visually read as one. The hardcoded Ahmedabad/no-hidden-charges line (\$2) was the only other unsupported claim found anywhere in the public component tree.

20–24. Sticky CTA, Responsive, Accessibility & Performance

Area	Finding
Mobile sticky CTA	WhatsApp + Call + Check availability combined; safe-area-inset present; z-50 correctly below modal z-60
Responsive	Not click-tested at all 6 widths (no browser automation available) — reviewed breakpoints in code, no obvious overflow found
Accessibility	Existing aria-label/aria-expanded/role usage already fairly thorough — no high-confidence gap found
Performance/CWV	Hero image already uses fetchPriority="high" + explicit dimensions (good for LCP/CLS) — not independently re-measured

24–26. Lead Success, CRM & Analytics

Lead success UX fixed alongside §6/§7 — now clearly states "This is a request, not a confirmed booking," offers WhatsApp as an alternate channel. **CRM verification:** not performed live (requires a real browser submission); the RPC payload structure was read and confirmed unchanged/correct. **Analytics:** zero click-tracking instrumentation found anywhere in the public components — documented gap only, per instruction not to activate analytics this phase.

27–29. Files Changed, Database Changes & Automated Tests

File	Change
portfolio-sections.tsx	Availability success-state rewrite, empty-state guards (Gallery/Transformations/Packages/FAQ), fabricated-copy fixes
portfolio.\$slug.tsx	Nav built from real section data instead of a static list

Database changes: zero. `tsc --noEmit` clean, ESLint clean (one pre-existing unrelated warning), production build succeeded.

30–32. Manual Tests, Deferred Items & Next Phase

Note: `hd-bridal-makeup` and `nail-art` are currently `is_active: false` in live data (from earlier manual testing) — 404s during smoke test were expected, not a regression. Reactivate before your own click-through of TEST C.

Deferred OPTIONAL (documented, not implemented): a direct "Check availability" action on service cards (currently WhatsApp + "View service" only); making the service-page's own cross-page nav data-driven the same way; a floating-vs-inline WhatsApp consolidation review once real click data exists.

Recommended next phase: none proposed. Stopping per STOP condition — no deploy, no hosting change, no analytics, no cover-hero experiment. Awaiting manual approval.
