

BEAUTYFOLIO · PHASE 3G.2 · STAGE 1

CRM Data Hygiene Audit + Cleanup Plan

A complete read-only audit of every lead, inquiry, service-link and activity row in the CRM — classifying each into invalid/test/duplicate/legitimate/ambiguous — with a fully specified, reviewable cleanup plan. Zero writes performed. Waiting for explicit approval before Stage 2.

Writes performed

0 — read-only

Records audited

13 leads, 21 activities

Orphan rows found

PROPOSED MERGE

2

AMBIGUOUS — FLAGGED ONLY

3

CLEAN, UNTOUCHED LEADS

1. CRM Relationship / Dependency Map

Child → Parent	ON DELETE
lead_inquiries.lead_id → leads.id	CASCADE
lead_activities.lead_id → leads.id	CASCADE
lead_inquiry_services.inquiry_id → lead_inquiries.id	CASCADE
leads.service_id → services.id	SET NULL
leads.package_id → packages.id	SET NULL

Critical implication for Stage 2: naively deleting a "duplicate" lead row would cascade-destroy its inquiries and activities irreversibly. Any real merge must re-parent (`UPDATE ... SET lead_id`) inquiries and activities to the canonical lead **first**, then delete the now-childless redundant row.

2–4. Table Counts, Invalid Phones & Test Records

Baseline: 13 leads · 13 inquiries · 10 inquiry-service links · 21 activities · all under 1 beautician profile. **0 orphan rows found anywhere** (0 orphan inquiries, 0 orphan inquiry-service links, 0 orphan activities, 0 bad FKs, 0 leads with no inquiries, 0 leads with multiple inquiries).

Lead ID	Name / Phone	Activities	Note
95bf77ab	dd / dd	0	Junk + test
1f670b87	dd / ddd	0	Junk + test
87c6989c	Test Lead (curl) / 9999999999	0	Self-labeled test
88ac50a6	Tulsi / Shah	1 (auto-note only)	Invalid phone, zero staff engagement

fc7b8f6	Pooja / Singh	1 (auto-note only)	Invalid phone, Pooja cluster
4bd28ca9	Pooja / Singh	1 (auto-note only)	Invalid phone, Pooja cluster
ad8daeeb	Kavya / Shukla	6 (real staff work)	Do not delete — see §9

5–8. Duplicate Customer & Inquiry Groups, Repeat Enquiries, Orphans

Exactly one valid-phone duplicate-customer group found: normalized phone 8320699679 → leads f7030156 (06:39:30) and e56a2788 (06:40:02), 32 seconds apart, same service/date/venue, slightly different free-text message — a form resubmit, not two real events. No other phone repeats. **No legitimate repeat-customer examples currently exist** in the data (no phone has genuinely different service/date enquiries yet).

9. Ambiguous Records — Do Not Touch Without Your Review

`ad8daeeb` "Kavya" / phone "Shukla" — 6 real activities (status changes, WhatsApp follow-ups: "reminder on whatsapp", "coming to meet. just wa to remind"), active follow-up reason "outstation". First activity is "Lead added manually." — **entered through the dashboard's own manual-add form, not the public form**, revealing a separate unvalidated phone-entry path there (a finding for a future phase, not fixed here). Recommend manual phone correction, never deletion.

`8c28d837` "Navya Panchal" / phone "989898989" — 9 digits, passes the generic 8–15 range but is an odd repeating pattern one digit short of standard India mobile length. 9 real activities, qualified status, active follow-up. Flagged only because the pattern is suspicious — no reliable automated way to confirm typo vs. genuine number.

10–14. Canonical Selection, Merge & Preservation Strategy

Canonical lead: `f7030156-4268-4eeb-8d98-6fca545642d2` (earlier of the Pooja Singh pair, no conflicting status/follow-up data with its duplicate).

- 1. Re-parent the redundant lead's inquiry: `UPDATE lead_inquiries SET lead_id = f7030156 WHERE id = e0ae278e` — kept as a **second, separate** inquiry row, never flattened into one
- 2. Re-parent its 1 activity to the canonical lead
- 3. Only then delete the now-childless redundant lead row `e56a2788`

Result: 1 canonical lead, 2 preserved inquiries (both submissions remain visible — real information, not discarded), all activities intact. `lead_inquiry_services` rows are never touched directly — they cascade automatically with their re-parented (never deleted) parent inquiry.

15–17. Exact Candidates & Rows Not to Touch

Action	Lead(s)
Proposed deletion (6 rows, zero real engagement)	<code>95bf77ab</code> , <code>1f670b87</code> , <code>87c6989c</code> , <code>88ac50a6</code> , <code>fc7b78f6</code> , <code>4bd28ca9</code>
Proposed merge (1 redundant → 1 canonical)	<code>e56a2788</code> → <code>f7030156</code>
Explicitly NOT to touch	<code>76a2b735</code> (Rikesh), <code>c3ff2e89</code> (tushar), <code>4c76e672</code> (Jay Jogiya) — clean legitimate leads; plus both \$9 ambiguous rows

18–20. Backup Plan, Database Changes & Approval Needed

Database changes performed: zero. Every query this phase was a read-only `SELECT` , via the verified Lovable MCP connection against `ivbujlyilzm1ub1qzalu` . Every candidate row's full current state (name, phone, service, event date, activity content, inquiry content) is captured in this report as the pre-cleanup snapshot; Stage 2 will re-select and print exact row contents immediately before any write, inside a single transaction.

Manual approval required before Stage 2:

- 1. Approve deleting the 6 rows above (all zero real engagement beyond an auto-generated note)
- 2. Approve the Pooja Singh merge (canonical: `f7030156`)

3. Decide on the 2 ambiguous rows (Kavya/Shukla, Navya/989898989) — recommendation: leave both alone, correct phone numbers manually yourself, since real follow-up history exists on both

Stopping here per the phase's STOP condition — no deletes, no merges, no updates performed. Waiting for explicit approval.
