

BEAUTYFOLIO · PHASE 3G.2B

Jay Jogiya Duplicate Merge — Stopped

The pre-flight reselect required before any write revealed the live data no longer matches the 3G.2A audit — the "redundant" lead has since accumulated more real enquiry history than the proposed "canonical" one. Per the phase's own explicit safety condition, the merge was stopped before any write. Zero rows touched.

Writes performed	Trigger	Outcome
0	Live data diverged from audit	Stopped, corrected direction proposed

0
ROWS CHANGED

3
NEW INQUIRIES FOUND
ON "REDUNDANT" LEAD

2
LEAD ROWS —
UNCHANGED TOTAL

1
CORRECTED PROPOSAL
AWAITING APPROVAL

STOP condition triggered. The phase explicitly instructed: *"If any material data has changed since the 3G.2A audit: STOP and report"* and *"If the newer lead now contains materially richer customer/follow-up data: STOP and report before merging."* Both conditions were met by real, live data — so no transaction was opened and nothing was written.

1–2. Proposed IDs (as originally specified)

Canonical (proposed): 4c76e672-238b-48fc-be64-1960797a8289 . Redundant (proposed): 5f5fdad4-8ac8-4f1c-b3c2-5befcf5e3357 .

3. Pre-Flight Comparison — Material Change Detected

Field	3G.2A audit (Lead B)	Live now (Lead B)
service_requested	Hair Styling	HD Bridal Makeup
event_date	2026-08-29	2026-08-26
updated_at	= created_at	23 min after creation
Inquiry count	1	3
Activity count	1	4

Full inquiry history now under the proposed "redundant" lead:

Inquiry	Service	Event date	Created
58387c63	Hair Styling	2026-08-29	08:11:59 (original)
8774da64	Hair Cutting	2026-08-28	08:30:38 (new)

515bc41b	HD Bridal Makeup	2026-08-26	08:31:22 (new)
----------	------------------	------------	----------------

What Happened — Positive Confirmation of Phase 3G.2A

Since 3G.2A's fix went live, phone 7359445506 was submitted through "Add Lead" at least twice more. The new customer-matching logic correctly found the existing phone match each time and reused the same lead rather than creating new duplicate rows — confirmed by a direct count: still exactly 2 total lead rows for this phone, not 4. This is real, live confirmation the 3G.2A fix works. But it also means the "redundant" lead is no longer sparse — it is now the materially richer record.

4. Canonical-Selection Confirmation — Failed (By Design)

Proceeding with the originally-approved direction (merge the richer lead into the sparser one) would discard the record that has been correctly accumulating real enquiry history since the fix shipped. This is exactly the scenario the phase instructed not to proceed through automatically.

5–14. Not Performed

No inquiries re-parented, no service relationships touched, no activities moved, no source-history activity added, no snapshot fields changed, no deletion performed. No transaction opened. Final CRM counts are unchanged (no writes occurred). No other customer (Pooja Singh, Kavya, Navya, Rikesh, tushar) was queried or touched.

15–17. Database/Code Changes

Zero, as expected — this was a read-only pre-flight check.

18. Recommendation — Corrected Direction, Awaiting Your Approval

The merge should still happen, but in the corrected direction:

- Canonical: 5f5fdad4-8ac8-4f1c-b3c2-5befcf5e3357 — 3 inquiries (Hair Styling, Hair Cutting, HD Bridal Makeup)
- Redundant: 4c76e672-238b-48fc-be64-1960797a8289 — 1 inquiry (Hair Cutting, from the original public-form submission)

Both still share phone 7359445506 , both status "new", no conflicting follow-up data on either — still a clean merge, just reversed from the original proposal. Please confirm before Stage 2 runs with the swapped canonical/redundant roles — nothing has been touched.

Stopping here — not beginning another phase, no merge executed.
