

BEAUTYFOLIO · PHASE 3G.3

Conversion Analytics + Lead Attribution Foundation

A minimal, vendor-neutral event layer — zero hardcoded provider IDs, zero PII, zero database changes — instrumenting portfolio/service views, availability CTAs, WhatsApp clicks, and the full availability-form funnel across the public portfolio and service detail pages.

Schema/code changes

DB / SCHEMA CHANGES

1–5. Audit & Architecture

Grepped the entire repo for gtag/dataLayer/GTM/GA4/Meta Pixel before writing anything — **none existed**, confirming a genuinely new foundation. Chose `window.dataLayer` — the standard interface both GTM and GA4/gtag.js already consume, and that Meta's CAPI tooling can be pointed at later via a GTM trigger. No SDK installed, no script loaded unless a real `VITE_GTM_ID` is configured — currently unset, so the app ships with zero analytics network calls today.

6–7. Event Taxonomy

Event	Fires when
<code>portfolio_view</code>	Portfolio page loads (deduped per profile slug)
<code>service_view</code>	Service detail page loads (deduped per service path)
<code>availability_cta_click</code>	Any "Check availability" CTA is clicked
<code>availability_form_start</code>	First field interaction in the availability form (once per form instance)
<code>availability_form_submit</code>	Form submitted (right after preventDefault)
<code>availability_form_success</code>	Only after the submit_lead RPC actually succeeds
<code>whatsapp_click</code>	Any WhatsApp link is clicked

`service_cta_click` / `package_cta_click` were deliberately excluded — audited as redundant with `service_view` + `whatsapp_click` / `availability_cta_click` already carrying `cta_location`.

8–17. Configuration, Privacy & Dedup Discipline

- Env convention:** `VITE_GTM_ID`, following the exact pattern of `src/lib/site-url.ts` — trimmed, empty-string fallback, never hardcoded.

No-PII rule: `availability_form_success` carries only `profile_slug`, `page_path`, `service_id`, `service_name`, `event_date_present` (boolean), `lead_source` — never name/phone/message/location text. No call site anywhere passes free-text customer input to

trackEvent.

Dedup: `useTrackedPageView` fires at most once per key via a `useRef` guard — survives SSR, hydration, and React Strict Mode's dev double-invoke, while still firing again on genuine navigation to a different profile/service. Form-start uses a single `onChangeCapture` handler on the `<form>` element, not one per field.

WhatsApp honesty: event is named `whatsapp_click`, never `whatsapp_message_sent` — no delivery claim.

CTA-location vocabulary: one shared typed set (`hero`, `hero_card`, `service_card`, `package_card`, `availability_section`, `final_cta`, `mobile_sticky`, `floating_whatsapp`, `service_detail_header`, `service_detail_hero`) — never free text.

18–20. Lead-Source, UTM & Referrer Audit

Lead-source architecture: `leads.source` (channel-level) plus the `beautician_profile_id` FK already answers "which professional." There is **no** persisted per-inquiry CTA-location or service-page attribution in the CRM — the new analytics events answer that, but only in the analytics layer, deliberately not the CRM (zero-schema-change scope for this phase).

UTM audit: confirmed zero UTM capture anywhere in the repo (grep for `utm_source/utm_campaign/URLSearchParams` — no matches). No migration applied. Persistent CRM-level UTM attribution would need a new column — flagged as future work per the phase's own STOP-and-report instruction, not implemented now.

Referrer audit: confirmed zero `document.referrer` capture. Feasible as a non-invasive analytics-only property later; out of this phase's minimum-foundation scope.

21–23. Future-Readiness & Debug Safety

No Google Ads/Meta conversion or pixel IDs invented anywhere — everything routes through `dataLayer` so a real GTM container can wire these up later with zero app code changes. No internal lead UUID is ever passed to `trackEvent`. Debug output is `console.debug`, gated on `import.meta.env.DEV` only — never production, never a dashboard.

26. Files Changed

- `src/lib/analytics.ts` **NEW** — core event layer, taxonomy, CTA-location vocabulary, `useTrackedPageView` hook
- `src/routes/__root.tsx` — conditional GTM loader script + noscript fallback, only when `VITE_GTM_ID` is set
- `src/routes/portfolio.$slug.tsx` **NEW** — `portfolio_view` tracking
- `src/components/portfolio/portfolio-sections.tsx` — full CTA instrumentation: hero, service rows, packages, availability form funnel, final CTA, mobile sticky, floating WhatsApp
- `src/routes/portfolio.$slug.services.$serviceSlug.tsx` **NEW** — `service_view` tracking + independent header/hero/final/mobile-sticky CTA instrumentation

27–30. Regression & Quality Gates

Check	Result
Performance (blocking scripts)	None — GTM loader async, zero network cost while unconfigured
SEO regression	Zero — no head/JSON-LD metadata touched
CRM regression	Zero — no CRM write paths touched
<code>tsc --noEmit</code>	Clean
ESLint	0 errors (1 pre-existing style warning, not introduced here)
<code>npm run build</code>	Succeeded
Route smoke tests	All 200: <code>/portfolio/dharti-panchal</code> , <code>/dashboard/leads</code> , <code>/dashboard/services</code> , <code>/portfolio/dharti-panchal/services/sider-makeup</code> , <code>/sitemap.xml</code> , <code>/robots.txt</code>

31. Event Verification Matrix

Trigger	Event	Key properties	PII	Duplicate protection
---------	-------	----------------	-----	----------------------

Portfolio page load	portfolio_view	profile_slug, page_path	No	ref-guard by slug key
Service page load	service_view	profile_slug, service_id, service_name, page_path	No	ref-guard by service path key
"Check availability" click	availability_cta_click	cta_location, service_name?, page_path	No	click-driven, none needed
First form field interaction	availability_form_start	page_path	No	single onChangeCapture handler
Form submit	availability_form_submit	page_path	No	fires once per real submit
RPC success	availability_form_success	service_id, event_date_present, lead_source	No	only reached after server confirms
WhatsApp link click	whatsapp_click	cta_location, service_name?, page_path	No	click-driven, none needed

32. Manual Browser Test Steps (Not Executed)

No browser automation is available in this environment (consistent with this entire session). Steps A–J were documented but not run: (A) load portfolio, confirm one portfolio_view debug line; (B) navigate away/back, confirm it fires again; (C) click a CTA, confirm availability_cta_click with correct cta_location; (D–E) type into the form, confirm exactly one form_start; (F) submit, confirm submit then success events with no PII; (G) click WhatsApp, confirm whatsapp_click; (H–I) visit a service page, confirm service_view and its own CTA locations; (J) set/unset VITE_GTM_ID, confirm the GTM script and noscript iframe appear/disappear accordingly.

Stopping here per the phase's explicit STOP condition — no further phase started automatically.
