

BEAUTYFOLIO · PHASE 3G.3B

CRM Attribution + Channel Rollup

A lightweight, read-only Insights view inside the existing Leads manager — enquiry counts, source/UTM/campaign/service/CTA breakdowns, all cross-verified against live data. Zero schema changes, zero CRM record can be edited from this view.

Placement	Database changes	Live enquiries analyzed
4th view mode in /dashboard/leads	0	15 (9 unique customers)

15

TOTAL ENQUIRIES (ALL TIME)

9

UNIQUE CUSTOMERS

1

UTM-ATTRIBUTED

13

UNATTRIBUTED / HISTORICAL

1–4. UX Placement & Metric Definitions

Extended the existing List / Cards / Pipeline view switcher on `/dashboard/leads` with a 4th mode, **Insights** — no new route, matching the CRM's own navigation pattern. When active, the Today command center and per-lead filters hide, since Insights is an aggregate rollup, not a per-lead worklist.

Total enquiries = count of `lead_inquiries` rows in range. **Unique customers** = distinct `lead_id`. **UTM-attributed** = `utm_source` present. **Unattributed/historical** = `source`, `utm_source`, `referrer_host`, AND `cta_location` all NULL — never relabeled "Direct." Coverage is reported as three separate honest percentages (Source / UTM / CTA recorded) rather than one collapsed score, since source alone trends toward 100% and would be misleading on its own.

Live Breakdown — Source

Unknown / historical	13 · 86.7%
Portfolio	2 · 13.3%

Live Breakdown — Service Demand

Service	Enquiries
HD Bridal Makeup	4
Hair Cutting	3
Bridal Makeup	2
Nail Art / Airbrush Bridal Makeup / Hair Styling / Eyebrow / Skin Treatment / HD Makeup	1 each

Counting rule: an enquiry linked to multiple services contributes once to each service's count — the sum across services can exceed total enquiries. This is deliberate (service demand, not a partition of enquiries).

Live Breakdown — CTA & Campaign

CTA location	Enquiries
Unknown / historical	14
service_detail_hero	1

Campaign table shows `bridal_test` (google / cpc) with 1 enquiry — the real, manually-tested attribution flow from Phase 3G.3A.

5–19. Design Decisions

Date filter: 7d/30d/90d/all, default 30d, strictly on `lead_inquiries.created_at` (never `event_date`). Live-verified genuinely different counts: 7d=13, 30d=15, 90d=15, all=15.

UTM channel / campaign: raw recorded `utm_source/utm_medium/utm_campaign` values only — no invented groupings, no revenue/ROAS/CPA/conversion-rate columns (explicitly excluded, \$9).

Landing/conversion pages: pathname-only top-10 lists; conversion pages kept as a secondary section.

Referrer: conditionally rendered — currently absent, since zero non-null `referrer_host` values exist yet; will appear automatically once real data arrives.

Explicitly NOT built: conversion rate (no session/traffic denominator exists), pipeline-performance-by-channel (status is customer-level, attribution is enquiry-level — combining them risks misleading conclusions), revenue/LTV (no billing data exists yet).

20–25. Architecture, Security & Privacy

Database changes: zero. Single query per rollup — `lead_inquiries` joined to `leads!inner(beatician_profile_id)` (explicit scoping, defense in depth beyond RLS) and `lead_inquiry_services(service_tag)` inline, avoiding N+1. All grouping happens server-side in `lead-insights.server.ts` — only aggregated counts cross to the browser.

Privacy: the `select()` never touches name/phone/email/message/notes — confirmed by code review, only channel/campaign/service/path fields are fetched or rendered anywhere in the Insights view.

Security: ownership resolved via `getOwnBeaticianProfileId()` and applied as an explicit filter on top of unchanged RLS policies — never assumes a single global profile.

26–27. Responsive Design

Reused the existing StatCard visual language — no new charting library installed. Breakdown sections use a 2-column grid on desktop collapsing to 1 column on mobile; bars are plain CSS width divs; all lists stack vertically with no horizontal overflow.

22. Files Changed

- `src/data/lead-insights.server.ts` **NEW** — aggregation + types
- `src/components/leads/lead-insights-view.tsx` **NEW** — read-only rollup UI
- `src/routes/dashboard.leads.tsx` — 4th view mode, insights query, conditional layout

28. Quality Gates

Check	Result
<code>tsc --noEmit</code>	Clean
ESLint	0 errors after autofix
<code>npm run build</code>	Succeeded
Route smoke tests	All 200: <code>/dashboard/leads</code> , <code>/portfolio/dharti-panchal</code> , service page, <code>/sitemap.xml</code> , <code>/robots.txt</code>

29. Test Matrix Results (SQL-cross-verified against live data)

Test	Result
A — 30-day summary	PASS 15 total / 9 customers / 1 UTM / 13 unattributed — matches raw data
B — source breakdown	PASS Unknown 13 (86.7%), Portfolio 2 (13.3%)
C — campaign	PASS google/cpc/bridal_test appears, count=1
D — service	PASS HD Bridal Makeup=4, matches lead_inquiry_services
E — CTA	PASS service_detail_hero=1, rest Unknown
F — date filter	PASS 7d=13, 30d=15, 90d=15, all=15
G — historical NULL	PASS renders "Unknown / historical," never "Direct"
H — security	Code-verified — explicit profile scoping + unchanged RLS
I — zero-data range	Code-verified — dedicated empty state, no "0% performance"
J — mobile	Not browser-tested — manual check required

30–32. Manual Checks, Limitations & Next Phase

Manual browser checks needed: open Leads → Insights, cycle all 4 date ranges, confirm the numbers above, resize to phone width and confirm no horizontal scroll, confirm nothing in this view can edit a CRM record.

Known limitations: no drill-down from a breakdown row into the filtered lead list (deferred, would need cross-view filter state); referrer section stays hidden until real external-referrer data arrives; coverage percentages will trend upward over time simply because source now defaults on every new enquiry — expected, not a quality signal by itself.

Recommended next phase (not started): a small "click a row to filter the list view" drill-down — still explicitly not Google Ads/Meta integration or Customer Growth OS.

Stopping here per the phase's explicit STOP condition.
