

BEAUTYFOLIO · PHASE 3G.3D

Customer Multi-Enquiry History Workspace

The customer detail dialog now correctly shows ONE CUSTOMER → MANY ENQUIRIES — every enquiry with its own service(s), event details, source and attribution, never merged into a single latest-enquiry summary. Zero schema changes, zero additional queries.

New queries added

SCHEMA CHANGES

1–2. Audit & Field Classification

Found the exact bug this phase targets: the old "Customer & inquiry summary" grid mixed customer-level fields (email, `leads.source`, `leads.created_at` labeled "Received") with latest-enquiry-only fields (event date/type/persons/location/venue/services) as if they were one coherent record. The Attribution block also only ever read the single latest inquiry. Confirmed live: `lead_activities` has no `inquiry_id` column — activities correctly remain customer-level only, not per-enquiry.

Field	Level	Table
name, phone, email	Customer	leads
status, follow-up, notes	Customer/CRM	leads
event_date, services, location, venue	Enquiry	lead_inquiries / lead_inquiry_services
source, utm_*, landing/conversion path, CTA	Enquiry	lead_inquiries
activities, status changes	Customer/CRM timeline	lead_activities (no inquiry_id)

3. Query Architecture — Zero New Queries

`LeadWithInquiry` extended with `inquiries: LeadInquiry[]` (newest first) alongside the existing `inquiry` field. The underlying query already fetched every inquiry via the join — the mapping function simply stopped discarding everything past index 0. No new server function, no N+1, fully backward-compatible with every existing List/Cards/Pipeline/Add-dialog consumer.

4–11. Workspace Redesign

Customer header: added "N enquiries · email" — genuinely customer-level facts only; `leads.source` removed entirely from the summary (previously shown as a fake permanent attribute).

Enquiries section: new accordion — newest first, "Latest enquiry" badge on the newest, collapsed by default except the latest to avoid excessive length. Each card independently shows its own service(s), event details, source, and attribution — using `lead_inquiry_services` and `lead_inquiries`, never the stale `leads.service_requested` / `leads.source` snapshot.

Source labeling: a dedicated `enquirySourceLabel()` treats NULL as "Unknown / historical" — never "Manual Entry", never "Direct" — matching the exact semantic already established in Insights (3G.3B/3G.3C).

Attribution: renders per-card only when that specific enquiry has real values — never merged across enquiries.

Live Verification

Customer	Enquiries	Result
Jay Jogiya	6	Eyebrow, Airbrush Bridal Makeup, HD Bridal Makeup, Hair Cutting ×2, Hair Styling — each its own card, all source=Unknown/historical
Pooja Singh	2	Both HD Bridal Makeup, shown as two separate cards, not merged
Ravi Patel	1	The real attributed enquiry — google/cpc/bridal_test/service_detail_hero/Nail Art all correctly present

12–17. CRM Sections Preserved Unchanged

Pipeline status, follow-up (next_followup_at/reason, last_contacted_at), activity timeline, and internal notes are all completely untouched — still one customer-level value each, visually separate from the new Enquiries section. The existing "Matched via Insights" banner from 3G.3C is preserved; per-card "Matches insight" tagging was deliberately not added, since the drill-down API returns which customer matched, not which specific inquiry id(s) — a fragile heuristic was avoided per the phase's own "if excessive complexity, retain the existing banner only" instruction.

18–21. Empty State, Mobile, Accessibility, Security

Empty state ("No enquiry history recorded.") guards against a zero-inquiry customer. Cards are full-width stacked blocks — no tables, no horizontal scroll risk. Accordion headers are real `<button>` elements with `aria-expanded` / `aria-controls` — keyboard operable. No new query surface was introduced, so security/RLS posture is unchanged from before this phase.

22–24. Files, Database & Performance

- `src/data/leads-query.server.ts` — `LeadWithInquiry.inquiries` added (zero new queries)
- `src/components/leads/lead-detail-dialog.tsx` — new `EnquiriesSection/EnquiryCard`, old single-inquiry blocks removed
- `src/routes/dashboard.leads.tsx` — added `key={selectedLead.id}` for correctness

Database changes: zero. Confirmed live that `lead_activities` has no `inquiry_id` — documented as an accepted limitation, not a trigger for a schema change in this phase.

25. Quality Gates

Check	Result
<code>tsc --noEmit</code>	Clean
ESLint	0 errors after autofix
<code>npm run build</code>	Succeeded
Route smoke tests	All 200: /dashboard/leads, /portfolio/dharti-panchal, service page, /sitemap.xml, /robots.txt

26. Test Matrix Results

Test	Result
------	--------

A — Jay Jogiya	PASS 6 cards, 5 distinct services, all independent
B — Pooja Singh	PASS 2 separate HD Bridal Makeup cards
C — Attribution (Ravi Patel)	PASS full attribution on the correct single card
D — Manual enquiry	Code-verified — real source shown, UTM absent when null
E — Historical enquiry	PASS "Unknown / historical", attribution section omitted
F — Latest enquiry	Code-verified — badge on newest card
G — Customer timeline	Unchanged, not touched
H — Status	Unchanged — one customer-level status
I — Insights drill-down	Code-verified — existing banner preserved
J — Mobile	Not browser-tested — manual check required
K — Security	Code-verified — no new query surface

27–29. Manual Checks, Limitations & Next Phase

Manual checks needed: open Jay Jogiya (6 cards), Pooja Singh (2 HD Bridal Makeup cards), Ravi Patel (attribution block); resize to phone width; drill into HD Bridal Makeup from Insights and confirm the match banner on Pooja Singh.

Known limitations: per-enquiry "Matches insight" tagging not implemented (drill-down API limitation, documented trade-off); activities remain customer-level only since lead_activities has no inquiry_id.

Recommended next phase (not started): adding a nullable lead_activities.inquiry_id would resolve both limitations — a genuine small schema change, correctly deferred per this phase's zero-schema-change constraint.

Stopping here per the phase's explicit STOP condition.
