

BEAUTYFOLIO · PHASE 3H.2A

Local → GitHub → Lovable Code Sync

The verified local codebase (Phases 3D–3H.1) was committed and pushed to the linked GitHub repository. Local→GitHub sync is fully verified. Lovable's own cloud project has not yet picked up the push — a manual platform check is required before Phase 3H.2 can resume.

Commit	GitHub push	Lovable sync
6d04104	Verified, HEAD parity confirmed	NOT YET REFLECTED

 CODE SYNC NOT VERIFIED — DO NOT PUBLISH / DO NOT RESUME 3H.2

Local → GitHub is fully done and verified. GitHub → Lovable has not happened yet, even after waiting — Lovable's project state is unchanged (same commit sha, same 404 on src/lib/attribution.ts). This requires a manual check inside Lovable's own web UI; no MCP tool can trigger it from this session.

LOVABLE PROJECT STILL
STALE

1–7. Pre-Commit Gates

Git audit: branch main, remote correctly rikeshjpanchal-svg/beautyfolio-launch-main, 10 modified + 1 deleted + ~73 untracked paths, no merge conflicts.

Secret/env audit: .env's only change is one added VITE_SITE_URL line — no key/token changed. No .dev.vars anywhere. Every "service_role" grep hit was a standard Postgres GRANT role reference in migration SQL, not a secret value. Safe to commit.

Exclusions: added one narrow .gitignore entry for supabase/.temp/ (CLI version cache, not project content) — no broad rewrite.

Scope: application code, 17 migration files (history only, none applied), documentation (docs/architecture, phase docs, docs/reports), generated types, one unrun tooling script, package-lock.json.

Build gate: tsc clean, 0 functional ESLint errors (115 pre-existing formatting issues outside scope, unchanged), production build succeeded.

8–11. Commit & Push

Step	Result
Commit created	YES — "BeautyFolio launch-ready application through Phase 3H.1"
Commit hash	6d041046e04953875296cb14db544adb1e8f596d
Commit contents	189 files, 45,551 insertions, 1,501 deletions — all 7 mandatory representative files confirmed present
GitHub push	SUCCEEDED — normal push, 187f49a..6d04104, no force, no divergence

Local/remote HEAD parity **EXACT MATCH** — both resolve to 6d04104...

12–15. Lovable Sync — Not Yet Reflected

Check	Result
latest_commit_sha (Lovable project)	Still d86105bb... (2026-08-23)
read_file(src/lib/attribution.ts)	Still 404 file_not_found — checked twice, before and after a 60-second wait, plus once more on a later follow-up check
Lovable preview screenshot	Unchanged metadata — same stale screenshot as Phase 3H.2

16–20. Unaffected Systems & No Production Actions

Backend re-verified unaffected: still ivbujlyilzmlublqzalu, 9 leads, dharti-panchal profile present. **Zero database or migration actions performed** — read-only verification only. **No production publish performed.** No DNS changed. No GTM configured.

The Exact Remaining Problem

Pushing to GitHub did not update Lovable's own project state, even after waiting. Lovable's GitHub connection for this project is either not configured for automatic pull-on-push sync, or isn't actively enabled in that direction — and no MCP tool exists to trigger or force it from this session.

Manual action required: open the project in Lovable's web UI (lovable.dev/projects/57a20777-d6f4-466c-9e84-03d4b6818b81) and check the GitHub integration/settings panel to either confirm the repo connection and manually trigger a sync/pull from main, reconnect/enable GitHub sync if inactive, or use whatever mechanism Lovable's own UI offers for pulling in this commit.

Final Verdict

B — CODE SYNC NOT VERIFIED. Phase 3H.2 (production Publish) must not resume until Lovable's project reflects commit 6d04104 — verifiable by re-checking that src/lib/attribution.ts no longer 404s from Lovable's own project state.
