

BEAUTYFOLIO · PHASE 3H.2A.1

Repository Root Flattening

The GitHub repository's incorrect nested structure (beautyfolio-launch-main/beautyfolio-launch-main/) was flattened to the correct root layout Lovable's GitHub sync expects. Verified via clean rename detection, a full local rebuild, and direct inspection of the pushed commit's tree.

Commit	Files moved	Database/Lovable changes
da18741	298 clean renames	Zero

✓ ROOT FLATTENED AND PUSHED — VERIFIED

GitHub's repository root now directly contains package.json, src/, public/, supabase/, and .lovable/ — confirmed both locally and by reading the pushed commit's tree directly. This should resolve the underlying cause of the sync failure found in Phase 3H.2A.

Before → After

Before (incorrect)	After (flattened)
beautyfolio-launch-main/ └─ beautyfolio-launch-main/ ├─ .lovable/ ├─ src/ ├─ supabase/ └─ package.json	beautyfolio-launch-main/ ├─ .lovable/ ├─ src/ ├─ supabase/ └─ package.json

1–3. Verification & Collision Audit

Git root confirmed: C:/Projects/BeautyFolio 2/beautyfolio-launch-main. Remote verified exact match: rikeshjpanchal-svg/beautyfolio-launch-main.git, branch main. Nesting confirmed exactly as reported — repo root held only .claude/, .git/, and the nested beautyfolio-launch-main/ folder; every real project file lived one level down. **Zero collisions** — the repo root's only pre-existing entries didn't overlap with anything inside the nested folder.

4. Files Moved

All 18 top-level tracked items moved via individual `git mv` calls, preserving rename history: .env, .gitignore, .lovable, .prettierrc, AGENTS.md, README.md, bun.lock, bunfig.toml, components.json, docs, eslint.config.js, package-lock.json, package.json, public, src, supabase, tsconfig.json, vite.config.ts. The 2 untracked report files generated this session moved along with the docs/

directory move. Gitignored build artifacts (node_modules, .output, .tanstack, .wrangler) were left behind and the now-empty nested folder was removed.

5–6. Final Structure & Quality Gate

Check	Result
src/lib/attribution.ts location	Confirmed at repo root: src/lib/attribution.ts
npm install (fresh, at new root)	420 packages, 0 vulnerabilities
tsc --noEmit	Clean
ESLint functional errors	0 (115 pre-existing formatting-only issues, unchanged)
npm run build	Succeeded — Worker name auto-corrected from the duplicated path to rakeshpanchal-svg-beautyfolio-launch-main

7–10. Git Review, Commit & Push

Git status after staging: 298 clean renames, 1 rename+modify (package-lock.json — content shift from the fresh install, expected), 2 new untracked report files. Zero unexplained deletions.

Commit: da18741646a3aa773a108ad86ab76614833d4dcd — "Flatten BeautyFolio project to repository root". Prior checkpoint commit (6d04104) untouched, not amended.

Push: normal, no force — 6d04104..da18741 main → main.

HEAD parity: local and origin/main both confirmed at da18741... after fetch.

Independent tree check: read origin/main's tree directly — .lovable/, docs/, public/, src/, supabase/, package.json, and src/lib/attribution.ts all confirmed present at the correct flattened paths on the pushed commit itself.

14–15. Database & Lovable Impact

Database changes: zero — no migration applied, no schema touched, file-system/git operations only. **Lovable changes: zero** — not reconnected, not published, not touched. Reconnection is deferred to a separate manual step per this phase's explicit instruction.

Next Step (Manual, Not Performed)

Check/reconnect Lovable's GitHub sync in its web UI now that the repo root structure is correct. Once done, re-verify by checking whether src/lib/attribution.ts resolves from Lovable's project state — if it does, Phase 3H.2 can resume from the Publish gate.

Stopping here per this phase's explicit STOP condition — no Lovable reconnection or publish attempted.
